ABSTRACT:

Poverty eradication means the complete destruction of poverty. Climate change means the change in global or regional climate patterns. These two concepts are related by some channels like food protection, job opportunities etc. Poverty is widely understood to be key factor that increases propensity for individuals and households to be harmed by climate shocks and stresses. This paper inquires into three questions namely, how poor people fall into poverty, how non poor people fall into poverty and how poor and non poor people escape from poverty due to climate change. There is an urgent need to solve these problems. So as a remedy, this project proceed towards poverty alleviation policies and poverty eradication strategy. This paper also answers, “how climate change will affect humanity?”.
